Radiated Emissions		ANSI C63.4:2003	FCC(B)	PASS	

specs_fccv100412

- #1 There is no specific limit on output power.
- #2 The additional note 6 was applied which allows a bandwidth of up to 22kHz providing the additional Adjacent Channel Power requirements are met.
- #3 The additional note 5 was applied which only stipulates limits 75kHz from the carrier providing the additional Adjacent Channel Power requirements are met.
- #4 Not applicable for devices operating in the 809MHz to 824MHz and 854MHz to 869MHz bands.
- #5 Not applicable as the EUT is not mains powered.

This Report shows that the EUT met all of the requirements for the tests performed - as shown above.

1 EUT Details

1.1 General

The EUT was a TETRA Voice + Data Hand Portable. The transmitter can operate over the following frequency bands:

809MHz to 824MHz - in Trunked-Mode Operation (TMO)

854MHz to 869MHz - in Direct-Mode Operation (DMO)

The receiver can operate over the following frequency bands:

854MHz to 869MHz

Measurements were made at the top, near middle and bottom of the appropriate frequency ranges:

Bottom: 809 MHz
Middle: 816.5 MHz
Top: 824 MHz

and

Bottom: 854 MHz
Middle: 861.5 MHz
Top: 869 MHz

The nominal output power is 32.5dBm (1.8W).

The product can be used on a standalone basis in which case it is powered from an internal battery. It can also be used in conjunction with a Car Kit in which case it is powered from a lead acid vehicle battery with nominal voltage of 13.2V.

This report additionally includes radiated emissions measurements:

- o with a Remote Speaker Microphone (RSM) connected;
- o in a Car Kit configuration.

All tests were performed on the STP9080 which is the fully featured unit. For the STP9280 variant it was only considered necessary to perform receiver mode radiated emissions measurements.

Unless otherwise stated, tests were performed with nominal power supply voltage.

The product is intended to comply with the FCC part 90 requirements - specifically the sections applicable to Tetra devices.

Radiated field strength tests were performed at the dB Technology Test Site Registered with the FCC: Registration number: 90528.

Output Stage Settings:

With reference to the requirements of **2.1046(a)** and **2.1033(c)(8)**, the DC voltages and currents in the elements of the final radio are regulated within the product and not user variable.

Modulation Characteristics:

With reference to the requirements of **2.1047**, the device uses digital modulation which is not proportional in any way to the level or frequency of the audio signal. We consider that compliance with the relevant Mask of Part 90 using pseudo random digital data is sufficient to adequately demonstrate the Modulation Characteristics as per Section 2.1047.

	Report No: R3406 Issue No: 1	FCC ID: XX6STP9080 / XX6STP9280	
	Test No: T5484		Test Report

1.2 Modifications to EUT and Peripherals

Details of any modifications that were required to achieve compliance are listed below. The modification numbers are referred to in the results sections as appropriate.

Mod No:	Details	Implemented for
0	Original sample as supplied.	
1	R104 changed from 82R to 1K. This resistor change adjusts the bias of the temperature compensation diodes.	

1.3 EUT Operating Modes

The EUT was tested in the following operating mode or modes. Generally, operating modes are chosen that will exercise the functions of the EUT as fully as possible and in a manner likely to produce maximum emission levels or susceptibility. Individual test result sheets reference the operating mode of the EUT.

Operating Mode	Details
1	Transmitting on selected channel.
2	Receiving on selected channel.

3 Test Methods

3.1 Antenna Conducted Carrier Power

The antenna output is connected to a spectrum analyser via a suitable PAD. The bandwidth on the spectrum analyser is set to greater than the EUT occupied bandwidth. A peak measurement is recorded. Additional measurements are made with antenna output connected to a power meter providing average measurements.

3.2 Antenna Conducted Transmitter Unwanted Emissions

Measurements are made with the antenna output connected to a spectrum analyser via a suitable PAD. Sweeps are made over the specified frequency ranges. The limit is set relative to the measured carrier power. A peak detector is used.

3.3 Antenna Conducted Occupied Bandwidth

Measurements are made with the antenna output connected to a spectrum analyser via a suitable PAD. Sweeps are made with a 300Hz Resolution Bandwidth and a 1kHz Video Bandwidth. A peak detector is used. Markers are used to determine the 99% power bandwidth.

3.4 Antenna Conducted Adjacent Channel Power

Measurements are made with the antenna output connected to an Tetra Test Set via a suitable PAD. The Analyser is set to make adjacent channel power measurements using the pre-configured settings for Tetra with 25 kHz channel spacing and 18kHz channel bandwidth.

3.5 Frequency Stability

The EUT is placed in an environmental chamber. The temperature inside the chamber is set to the required level and allowed to stabilise.

For DMO mode the antenna output is connected to a spectrum analyser via a suitable PAD. The EUT is set to transmit with constant carrier (at a frequency 2.25kHz above channel centre frequency). The frequency is measured using the frequency counter function of the spectrum analyser.

For TMO mode the antenna output is connected to a Tetra Test Set. The EUT is set to transmit using normal burst operation. the frequency error, as indicated by the Tetra Test Set, is recorded.

Measurements are made at the specified temperature and over the required voltage supply range of the EUT.

	Report No: R3406 Issue No: 1	FCC ID: XX6STP9080 / XX6STP9280	
	Test No: T5484		Test Report

3.6 Radiated Transmitter Emissions (Substitution Method)

Initial scans are performed in a semi-anechoic screened room at a distance of 3m. Scans are performed over the frequency range specified in the test standard with the antenna both horizontally and vertically polarised. During these scans the EUT and peripherals are rotated through 360°. Bench top EUTs are placed on a non-conducting bench at a height of 0.8m above the ground plane. Floor standing EUTs are placed 0.1m above the ground plane. The EUT cables were manipulated in an attempt to produce maximum emissions. The results of the scans are shown in the plots included at the end of the report.

Significant emissions identified by the scans are measured using a substitution method. Maximised emission readings are obtained by rotating the EUT through 360° and adjusting the height of the antenna from 1m to 4m. Measurements are made with the antenna both horizontally and vertically polarised and the results tabulated.

The EUT is then replaced with a calibrated reference antenna fed from a signal generator. The level fed into the reference antenna is measured with a power meter. Measurements are made to determine the power output of the signal generator required to give the same emission levels as were observed from the EUT.

The radiated power from the EUT is calculated as:

Signal Level fed into Reference Antenna	+ Gain of Reference Antenna	+ Radiated Level From EUT	- Radiated Level From Reference Antenna
---	-----------------------------------	------------------------------	---

For example, assuming following measurements:

Signal Level fed into Reference Antenna	= -14.3dBm
Gain of Reference Antenna	= 7.1 dBi
Radiated Level from EUT (i.e. Level at Measuring Receiver)	= 37 dBuV
Radiated Level from Reference Antenna (i.e. Level at Measuring Receiver)	= 61.5 dBuV

Then the Radiated Power from the EUT = -14.3 + 7.1 + 37 - 61.5 dBm (isotropic)
= -31.7 dBm (isotropic)

3.7 Receiver Radiated Emissions

Initial scans are performed in a semi-anechoic screened room at a distance of 3m. Scans are performed over the frequency range specified in the test standard with the antenna both horizontally and vertically polarised. During these scans the EUT and peripherals are rotated through 360°. Bench top EUTs are placed on a non-conducting bench at a height of 0.8m above the ground plane. Floor standing EUTs are placed 0.1m above the ground plane. The EUT cables were manipulated in an attempt to produce maximum emissions. The results of the scans are shown in the plots included at the end of the report.

Significant emissions identified by the scans are measured on an open area test site at the appropriate test distance using a CISPR16 quasi-peak receiver. Maximised readings are obtained by rotating the EUT through 360° and adjusting the height of the antenna from 1m to 4m. Measurements are made with the antenna both horizontally and vertically polarised and the results tabulated.

Tabulated results show levels based on the following calculation:

Field Strength (dBuV) = receiver reading (dBuV) + CF (dB/m)

CF is the correction factor for the antenna and cable.

For example:

at 114MHz receiver reading was 17.9 dBuV, combined correction factor = 13.1 (dB/m).

Total field strength = 17.9 + 13.1 = 31.0 dBuV/m.

Conducted Emissions (Signal)

Company: Sepura PLC		Product: STP9080/STP9280	
Date: 24/09/2014		Test Eng: Dave Smith	
Ports:	antenna		
Test:	90.205	using limits of	90.205(h)
Ports:			
Test:	using limits of		
Notes	Comments and Observations		
	Spectrum anlayser results using a peak detector are shown in plots 1 to 6.		
	Measurements were also made using a power meter with an average detector .		
	Measurements were made with continuous modulation.		
	Taking into account the loss of the cable and attenuators the following measurements were made:		
	Channel	Peak dBm	Average dBm
	809 MHz	36.5	33.8
	816.5 MHz	36.4	33.7
	824 MHz	36.6	33.7
	854 MHz	36.4	33.6
	861.5 MHz	36.4	33.7
869 MHz	36.5	33.7	

	Report No: R3406 Issue No: 1	FCC ID: XX6STP9080 / XX6STP9280	
	Test No: T5484		Test Report

Notes	Comments and Observations
#1	Results of scans shown in plots 43,47,51,52 and 56. During prescans in screened room these emissions were identified as narrow band. Measurements with a 30Hz RBW/30Hz VBW peak detector were no more than 1 dB lower than a measurement with a 120kHz QP detector. Because of ambients/noise floor, a 30Hz RBW/30Hz VBW peak detector was used on the open area test site and an additional 1dB added to the correction factor.
#2	Measured with 120kHz QP detector.
